# Fusion Toolpath Test

#201 1/4in Flat endmill - 5 x 5 x.75in MDF

-This will be a quick test cut made with gcode exported out of Fusion 360

-We will use the #201 endmill for both pocket and contour operations.

-This cut requires a 5 inch square of .75in thick MDF, you will want to measure from corner to corner and mark an X in the center of the square.

-The Zero will be set on the top surface of the stock, right in the middle of the X we marked originally.

-Once completed, please send in a photo of your completed cut to our support email and we'll be happy to take a closer look.
